Sustainability meets design

Richard Brink presents Nexum and Conar roof edge cover profiles

Schloss Holte-Stukenbrock, 14 October 2025:

No matter whether a flat roof has a level edge or parapets – in both cases the edge areas require appropriate covering to protect the structural fabric at the transition between wall and roof and to prevent moisture from getting into the façade. The Cavor edge profiles from Richard Brink GmbH & Co. KG have served this purpose as parapet covers for a long time. The Nexum and Conar roof edge cover profiles for flat roofs are the latest addition to the product portfolio of the metal products manufacturer from Eastern Westphalia.

When constructing and refurbishing flat roofs, protecting the roof edges is key to preventing moisture from getting into the transitions and the building façade: Richard Brink now offers the new Nexum and Conar roof edge cover profiles as part of its roof and wall systems product group, ensuring lasting and attractive edge protection along flat roofs.

Installed today with tomorrow in mind

Both product innovations have been designed with a circular economy in mind: they can be entirely dismantled and the materials sustainably reused.

The aluminium profiles, which come in a standard length of 3,000mm, are additionally wind resistant and water impermeable. The systems are designed for waterproof sheeting made from film with a thickness of up to 5mm or bitumen with a maximum of two overlapping sheets or a total sealing thickness of up to 10mm. Different heights between 100mm and 200mm are available, with optional coating in any RAL colour. The metal products manufacturer from Schloss Holte-Stukenbrock supplies both variants as a installation-ready full package with matching corners, end pieces and connectors.

Product information

Nexum product description

The three-part Nexum variant features an aluminium base profile, replaceable ABS plastic profiles to mechanically fix bituminous or foil sheeting, and snap-on trims (also aluminium) with rubber seals. The base profiles are screwed directly to the roof edge and the waterproof sheeting is then laid over the plastic clamping profile. Attaching the decorative trims, which simply clip to the base profile, then fixes the sheeting between the plastic clamping profiles and the trims securely and permanently.

Conar product description

The base profile and trim on the two-part Conar variant is manufactured as one component and is also fixed to the roof edge. Here, the installed foil or bitumen sheeting is held securely in place with the aid of an additional aluminium clamping profile integrated into the product's construction.

By expanding its range for parapets and roof edges, Richard Brink has created further flexibility for its customers in designing roof areas. The options within the range mean that the roof edge cover profiles can be adapted to any on-site conditions and satisfy all requirements.

Richard Brink is a medium-sized family-run company from Eastern Westphalia, now managed by the second generation. Over its 45-year history, the company has established itself on the market as an expert in metalware production. From product development and construction through manufacturing right up to advice and sales, the company manages and takes ownership of all processes in-house.

The product range comprises drainage and dewatering solutions, planting systems along with solutions for roof and wall areas, industrial applications, bathrooms and kitchens. Made-to-measure and custom-made products round off the comprehensive standard product range from the metal products manufacturer. Find more information at www.richard-brink.de.

Its sister company, Brink Systembau GmbH, is specialised in the trade fair and exhibition business and sells for instance flexible modular construction systems produced by Richard Brink GmbH & Co. KG. Additional products include fully back-lit LED illuminated walls or parcel lockers as a secure drop-off location for personal and commercial goods deliveries.
